

Assessment and Diagnosis of Depression

Diane Bloomfield MD

Assistant Professor of Pediatrics, Albert Einstein College of Medicine Associate Division Chief, Clinical Affairs Academic General Pediatrics Medical Director, Family Care Center Pediatrics Children's Hospital at Montefiore Bronx, New York

§ ProjectTEACH

Speaker:

Diane Bloomfield, MD, FAAP

Assistant Professor of Pediatrics, Albert Einstein College of Medicine Associate Division Chief, Clinical Affairs Academic General Pediatrics Medical Director, Family Care Center Pediatrics Children's Hospital at Montefiore Bronx, New York

Disclosures

Neither we nor our spouses/partners have a relevant financial relationship with a commercial interest to disclose.

We are paid by Project TEACH to give this CME

At the conclusion of this educational activity, participants should be better able to:

1. Discuss and follow both the United States' Preventive Services Task Force and GLAD PC's Recommendations on Screening for Adolescent Depression.

Why talk about adolescent depression?

Depression is Common in Teens

- Major Depressive Disorder
 - 1-2% for children (boys: girls-1:1)
 - 4-8% for adolescents (boys:girls-1:2)
 - By the end of adolescence: 11-20% lifetime
- Dysthymia
 - 1% for children
 - 5% for adolescents
- Sub-syndromal Depressive Symptoms

Office of

NEW

YORK

Depression Deraits Kids' Lives Now

- <u>Poor Self-Image</u>: negative view of self \rightarrow hopeless view of one's future \rightarrow suicidality
- <u>School</u>: decreased concentration, lack of motivation, poor energy → bad grades, school absences → school drop-out or decreased level of achievement
- <u>Peers:</u> irritable mood & decreased energy/motivation → conflict, drama, & decreased involvement in activities → loss of meaningful interpersonal relationships & a supportive social circle
- <u>Family</u>: irritable mood → conflict, drama → dismissed as bad kid, help not provided
- <u>Community</u>: irritable mood & decreased energy/motivation→ arguments with coaches/instructors, quitting activities → social isolation
 <u>Office of</u> <u>Mental Health</u> © 2017 New York State Office of Mental Health

Depression Derails Kids' Lives Later

- Psychosocial problems persist as deficits never gained
- Recurrent Depressions
- Recurrent Suicidality
- Substance abuse
- Poor employment if education disrupted
- Hospitalizations

NEW YORK STATE Office of Mental Health © 2017 New York State Office of Mental Health

Assessment of Depression

How do you know what to do?

Advocates for Universal Screening

- The USPSTF recommends screening for major depressive disorder (MDD) in adolescents aged 12 to 18 years.
- Screening should be implemented with adequate systems in place to ensure accurate diagnosis, effective treatment, and appropriate follow-up. (2016, 2009).

Other Advocates for Universal Screening (AAP, 2016, 2014)

Recommendations for Preventive Pediatric Health Care

Bright Futures/American Academy of Pediatrics

Each child and family is unique; therefore, these Recommendations for Preventive Pediatric Health Care are designed for the care of children who are receiving competent parenting, have no manifestations of any important health problems, and are growing and developing in a satisfactory fashion. Developmental, psychosocial, and chronic disease issues for children and adolescents may require frequent counseling and treatment visits separate from preventive care visits. Additional visits also may become necessary if circumstances suggest variations from normal.

These recommendations represent a consensus by the American Academy of Pediatrics (AAP) and Bright Futures. The AAP continues to emphasize the great importance of continuity of care in comprehensive health supervision and the need to avoid fragmentation of care. Refer to the specific guidance by age as listed in the Bright Futures Guidelines (Hagan JF, Shaw JS, Duncan PM. eds. Bright Futures: Guidelines for Health Supervision of Infants. Children. and Adolescents. 4th ed. Elk Grove Village, IL: American Academy of Pediatrics; 2017).

The recommend is statement do not indicate an exclusive course of treatment or standard of medical care.) aking into account individual circumstances, may be appropriate. Copyright @ 20 No part of this nermission fro

erican Academy of Pediatrics, updated February 2017. be reproduced in any form or by any means without prior written. an Academy of Pediatrics except for one copy for personal use.

	CIPATORY GUIDANCE	•	•	•	•	•	•	•	•	•	•	•	•				•	•	•	•	•	•	•		•	•	•					•	•

1. If a child comes under care for the first time at any point on the schedule, or if any items are not accomplished at the uggested age, the schedule should be brought up-to-date at the earliest possible time

- 2. A prenatal visit is recommended for parents who are at high risk, for first-time parents, and for those who request a conference. The prenatal visit should include anticipatory guidance, pertinent medical history, and a discussion of benefits of breastfeeding and planned method of feeding, per "The Prenatal Visit" (http://pediatrics.aappublications.org content/124/4/1227.full).
- 3. Newborns should have an evaluation after birth, and breastfeeding should be encouraged (and instruction and support should be offered)
- 4. Newborns should have an evaluation within 3 to 5 days of birth and within 48 to 72 hours after discharge from the hospital to include evaluation for feeding and jaundice. Breastfeeding newborns should receive formal breastfeeding. evaluation, and their mothers should receive encouragement and instruction, as recommended in "Breastfeeding and the Use of Human Milk" (http://pediatrics.aappublications.org/content/129/3/e827.full). Newborns discharged less than the Use of Human Milk" (http://pediatrics.aappublications.org/content/129/2/4827.full). Newborns discharged less that 48 hours after delivery must be examined within 48 hours of discharge, per "Hospital Stay for Healthy Term Newborns" (http://pediatrics.aappublications.org/content/125/2/405 full).
- 5. Screen, per "Expert Committee Recommendations Regarding the Prevention, Assessment, and Treatment of Child and Adolescent Overweight and Obesity: Summary Report" (http://pediatrics.aappublications.org/content/120/ Supplement_4/S164.full).

- 6. Blood pressure measurement in infants and children with specific risk conditions should be performed at visits before age 3 years.
- 7. A visual acuity screen is recommended at ages 4 and 5 years, as well as in cooperative 3-year-olds. Instrument-based screening may be used to assess risk at ages 12 and 24 months, in addition to the well visits at 3 through 5 years of age. See "Visual System Assessment in Infants, Children, and Young Adults by Pediatricians" (http://pediatri org/content/137/1/e20153596) and "Procedures for the Evaluation of the Visual System by Pediatricians" (http://pediatrics.aappublications.org/content/137/1/e20153597). ons.org/content/137/1/e20153597)
- 8. Confirm Initial screen was completed, verify results, and follow up, as appropriate. Newborns should be screened, per "Year 2007 Position Statement: Principles and Guidelines for Early Hearing Detection and Intervention Programs" (http://pediatrics.aappublications.org/content/120/4/898.full)
- 9. Verify results as soon as possible, and follow up, as appropriate
- 10. Screen with audiometry including 6,000 and 8,000 Hz high frequencies once between 11 and 14 years, once between 15 and 17 years, and once between 18 and 21 years. See "The Sensitivity of Adolescent Hearing Screens Significantly Improves by Adding High Frequencies" (http://www.jahonline.org/article/51054-139X(16)00048-3/fulltext).
- 11. See "Identifying Infants and Young Children With Developmental Disorders in the Medical Home: An Algorithm for Developmental Surveillance and Screening" (http://pediatrics.aappublications.org/content/118/1/405 full)

12. Screening should occur per "dentification and Evaluation of Children With Autism Spectrum Disorders" diatrics.aappublications.org/content/120/5/1183.full)

13. This assessment should be family centered and may include an assessment of child social-emotional health, caregive depression, and social determinants of health. See "Promoting Optimal Development: Screening for Behavioral and Emotional Problems' (http://pediatrics.aappublications.org/content/135/2/384) and "Poverty and Child Health in the United States" (http://pediatrics.aappublications.org/content/137/4/e20160339).

14. A recommended assessment tool is available at http://www.ceasar-boston.org/CRAFET/index.php.

15. Recommended screening using the Patient Health Questionnaire (PHQ)-2 or other tools available in the GLAD-PC toolkit and at http://www.aap.org/en-us/advocacy-and-policy/aap-health-Initiatives/Mental-Health/Documents/Me

- 16. Screening should occur per "Incorporating Recognition and Management of Perinatal and Postpartum Depression Into Pediatric Practice" (http://pediatrics.aappublications.org/content/126/5/1032).
- 17. At each visit, age-appropriate physical examination is essential, with infant totally unclothed and older children undressed and suitably draped. See "Use of Chaperones During the Physical Examination of the Pediatric Patient" (http://pediatrics.aappublications.org/content/127/5/991.full).
- 18. These may be modified, depending on entry point into schedule and individual need.

ESC	17. Has she often seemed to have trouble keeping her mind on her [schoolwork/work] or other things?	0	1
5	18. Has it often seemed hard for her to make up her mind or to make decisions?	0	1
A D	19. Has she said she often thought about death or about people who had died or about being dead herself?	0	1
	20. Has she talked seriously about killing herself?	0	1
	 Has she EVER, in her WHOLE LIFE, tried to kill herself or made a suicide attempt? 	0	1
CHIC	22. Has she tried to kill herself in the last four weeks?	0	1

October 11, 2007

NEW YORK STATE Office of Mental Health © 2017 New York State Office of Mental Health

DSM 5 Diagnostic Criteria for MDD

- A. Five (or more) of the following symptoms have been present during the same 2-week period and *represent a change from previous functioning*; at least one of the symptoms is either (1) depressed mood or (2) loss of interest or pleasure.
 - (1) Depressed mood or *irritable mood in kids!*
 - (2) Diminished interest or pleasure in all, or almost all, activities
 - (3) Significant weight loss or weight gain, or decrease or increase in appetite
 - (4) Insomnia or hypersomnia
 - (5) Psychomotor agitation or retardation
 - (6) Fatigue or loss of energy

NEW YORK STATE

- (7) Feelings of worthlessness or excessive or inappropriate guilt
- (8) Diminished ability to think or concentrate, or indecisiveness
- (9) Recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide

Depression in Adolescents:

- May appear less depressed than pre-pubertal counterparts
- Express more helplessness and hopelessness
- Experience greater anhedonia
- Begin to endorse excess sleep
- More apt to experience weight changes
- Somatic complaints
- Academic Difficulties
- Suicidality

Office of

YORK

• Behavioral Problems, Hostility

Mental Health © 2017 New York State Office of Mental Health

Interview Patient With Parent and Alone

- Follow up with further questions to determine coherence of story:
 - Is it persistent?
 - How long?
 - Interfering with function?
- Confirm positives on written screens and clarify nature, duration, onset, precipitants, what's been tried
- Look for comorbidity
- Screen suicidality
- Targeted PE

Labs only as indicated by history, physical exam

Assess for Comorbidity

- A child or adolescent with a depressive disorder will have a 20-33% chance of having another disorder
- Most commonly: anxiety disorders, conduct and oppositional disorders and dysthymic disorder
- MDD often precedes the onset of substance use disorders

Assess Psychosocial Functioning

- How impaired is this teen?
 - Is he missing class?
 - Is she getting good grades?
 - Has the school noticed a problem?
 - Is he still playing basketball on the team?
 - Has she continued to paint? Play music?
 - Are his friends still coming to visit?
 - Is she still going out to parties?
 - Does he participate in family outings?

ORK

Assess Psychosocial Functioning

- How impaired is this teen?
 - Is he missing class?
 - Is she getting good grades?
 - Has the school noticed a problem?
 - Is he still playing basketball on the team?
 - Has she continued to paint?
 - Are his friends still coming to visit?
 - Is she still going out to parties?
 - Does he participate in family outings?

Office of

Assess for Protective Factors

- Positive parent-child relationship
- Connection to school
- Prosocial peer group
- Sports
- Higher IQ

Assess for Genetic/family risk factors

- Genetic loading: Single most predictive factor associated with the risk of developing MDD
- Twin studies: 50% heritability; greater in adolescent-onset depression (Rice, 2009)
- Individuals with depression have been found to be homozygous or heterozygous for the less functional allele for the neuronal serotonin presynaptic reuptake site
 - This appears to predispose a person to react to ongoing stress with depressive symptoms

NEW YORK STATE Office of Mental Health © 2017 New York State Office of Mental Health

Assess for Suicide Risk

 Ask adolescent directly about ideation, impulses, and acts

 Ask parents directly about statements or behaviors suggesting suicidal ideation/feelings

Questions regarding suicide

- Thoughts:
- Do you ever feel so low that you just don't feel like going on?
- Have you ever wished you were dead?
- Have you ever thought about doing something to end your life? What has stopped you from acting on those thoughts?
- How often do you think about that? When was the last time? Now?
- Plans:
- How did you think about doing it?
- Have you ever taken any steps towards doing it?
- How close have you come to doing it?

• Have you ever actually done something to hurt yourself or try to kill yourself? Office of Mental Health © 2017 New York State Office of Mental Health

Questions about Suicide

- Have you ever felt so low that you wished you were never born?
- Sometimes when it gets this bad, people wish they were dead. Has this ever happened to you?
- Have you had thoughts about just ending it all?
- Have you thought about doing something to end your life?
- How did you think about doing it?
- How often do you think about that? When was the last time? Now?
- How close have you come to doing that?
- Have you ever taken any steps towards doing?
- Have you ever actually done something to hurt yourself or try to kill yourself?
- I'm glad that you are here speaking with me; what has stopped you from acting on your thoughts?

• That was a real attempt: How do you feel about still being here alive? Office of Mental Health © 2017 New York State Office of Mental Health

- Read the GLAD-PC Guidelines
- Prepare yourselves and your office to undertake the identification and management of adolescent depression
- Screen all adolescents ages 12 and up with a formal depression self-report tool
- Always be on the lookout for kids with risk factors for depression
- Remember that kids who come in with **ANY** behavioral chief complaint should be assessed for depression as well

- Talk with teens alone
- Get information from Parents and Caregivers
- Remember the DSM-5 criteria
- Functioning, functioning, functioning!
- Assess for safety
