

Aggression: Treatment

Zoya Popivker, DO
Child and Adolescent Psychiatrist
Northwell Health

Disclosures

"Neither we nor our spouses/partners has a relevant financial relationship with a commercial interest to disclose.

Learning Objectives

- Learn about a resource to help guide assessment and treatment of aggression
- 2. Identify the components of an effective treatment team including family members and professionals
- Understand the psychopharmacologic approach to clinical aggression

Poll:

- How common it is in your practice for families to come to you specifically with concerns about a child's aggressive behaviors?
 - Very Common
 - Once in a While
 - Rare

Poll:

- When a patient has presented with concerns about aggression, which of these strategies have you typically used? (Select all that apply)
 - Referred to a mental health or another specialist.
 - Prescribed or adjusted medication.
 - Monitored the situation with planned follow-up.
 - Felt unable to adequately address the issue.
 - Called Project TEACH.

TMAY - Treatment of Maladaptive Aggression in Youth

- Published in Pediatrics 2012
- Expert panel guidelines

T-MAY RECOMMENDATIONS

ASSESSMENT + DIAGNOSIS

Engage patients and parents (emphasize need for their on-going participation)
Conduct a thorough initial evaluation and diagnostic work-up before initiating treatment
Define target symptoms and behaviors in partnership with parents and child
Assess target symptoms, treatment effects and outcomes with standardized measures

INITIAL TREATMENT + MANAGEMENT PLANNING

Conduct a risk assessment and if needed, consider referral to mental health specialist or ER Partner with family in developing an acceptable treatment plan

Provide psychoeducation and help families form realistic expectations about treatment Help the family to establish community and social supports

PSYCHOSOCIAL INTERVENTIONS

Provide or assist the family in obtaining evidence-based parent and child skills training Identify, assess and address the child's social, educational and family needs, and set objectives and outcomes with the family

Engage child and family in maintaining consistent psychological/behavioral strategies

MEDICATION TREATMENTS

Select initial medication treatment to target the underlying disorder(s); follow guidelines for primary disorder (when available)

If severe aggression persists following adequate trials of appropriate psychosocial and medication treatments for underlying disorder, add an AP, try a different AP, or augment with a mood stabilizer (MS) Avoid using more than two psychotropic medications simultaneously

Use the recommended titration schedule and deliver an adequate medication trial before adjusting medication

SIDE-EFFECT MANAGEMENT

Assess side-effects, and do clinically-relevant metabolic studies and laboratory tests based on established guidelines and schedule

Provide accessible information to children and parents about identifying and managing side-effects. Use evidence-based strategies to prevent or reduce side-effects.

Collaborate with medical, educational and/or mental health specialists if needed

MEDICATION MAINTENANCE + DISCONTINUATION

If response is favorable, continue treatment for six months.

Taper or discontinue medications in patients who show a remission in aggressive symptoms ≥ 6 months

T-MAY Recommendations

Treatment Planning

- Conduct a risk assessment & if needed, consider referral to a MH specialist or ER, Urgent Care, CPEP, Mobile Crisis service
- Partner with family in developing an acceptable treatment plan
- Provide psycho-education to help families form reasonable expectations
- Help the family establish community & social supports

- -Parent To Parent of NYS <u>www.ptopnys.org</u>
- -NY State Parent Network parentnetworkwny.org
- -Families Together in New York State <u>www.ftnys.org</u>
 - Advocacy Group –Parent support
- -HealthyChildren.org
- -Understood <u>www.understood.org</u> high quality information about schools. ADHD, learning
- -National Alliance for the Mentally III: www.nami.org

T-MAY Recommendations

Psychosocial Interventions:

- Provide or assist family in obtaining evidence-based parent- and childskills training
- Identify, assess, and address the child's social, educational, & family needs, and set objectives & outcomes with the family
- Enlist & engage the child and family in maintaining consistent psychological & behavioral strategies

Psychosocial Interventions

Address the ongoing safety and ACES in the home

- Address educational issues
 - Assess school support: IEP, 504, need for behaviorist consult, FBA
- Refer for afterschool/summer activities
 - Structured community activities
- Counsel your families on parenting approaches
- Refer for evidence-based psychosocial interventions

Psychosocial therapies for aggression and comorbidity targets

Individual child therapies

- 1. CBT (cognitive behavioral) therapies for self management
- 2. Treatments for trauma or other comorbidity

Parent-child therapies for behavior

- 1. Parent education
- 2. PCIT
- 3. Triple P/PPP
- 4. Behavioral therapies focusing on managing antecedents and consequences (ABA)

School related supports and therapies

1. Data gathering and positive behavioral supports

Systemic therapies for older patients

- 1. Individual/parental/marital/family therapies
- 2. Multisystemic therapy

Child Only Psychotherapies

- Coping skills for child: learning how to calm self, what puts them in the aggressive "red zone", what to do to prevent, when best time to intervene
- An individualized recipe such as "modular" therapies for comorbidity of anxiety, trauma, depression, ADHD, conduct
- But BEST in concert with parent-child work

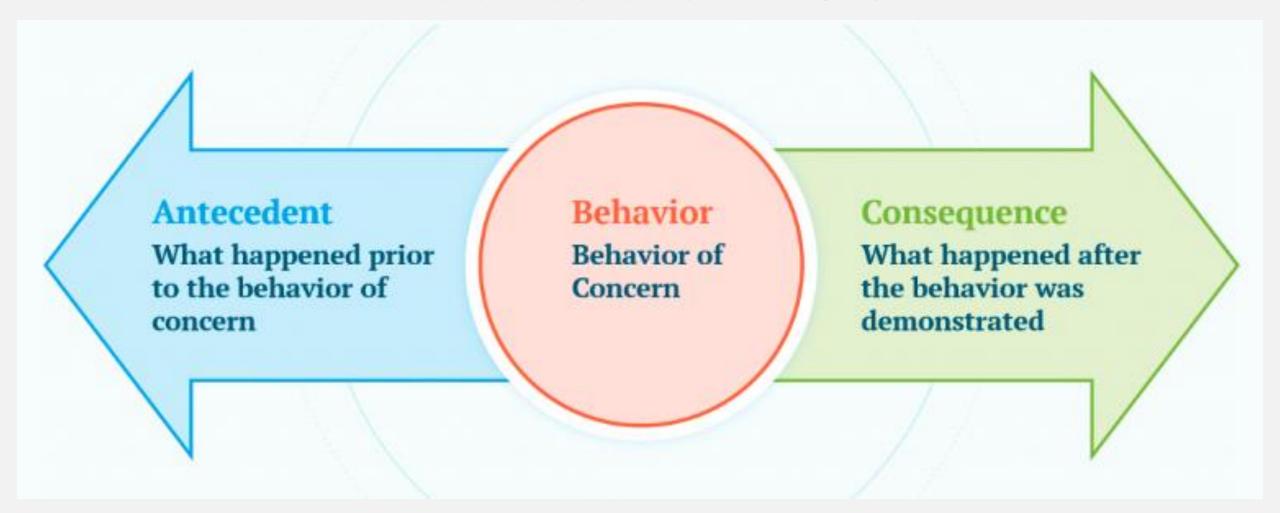

Parent-Child Therapies for Aggression

- Cycles of coercive aggression within a family can be intergenerational and trauma based (Gerald Patterson, 1980s)
 - Child observes modeled "successful" aggression in family
 - Escalation of violence by child to have family submit to child's wants (appeasement)
 - Pattern of aggression is reinforced in all family members
- Antecedents and consequences of aggression are important to consider in all cases. Assess disciplining styles of parents.
 Getting dads involved can turn the case around.
- THINK ABOUT A-B-C's

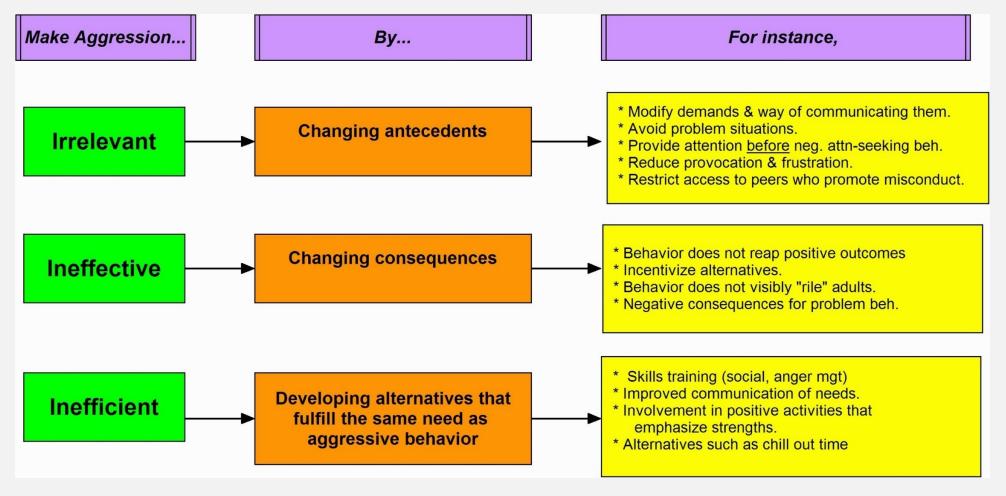

Back to the ABC's

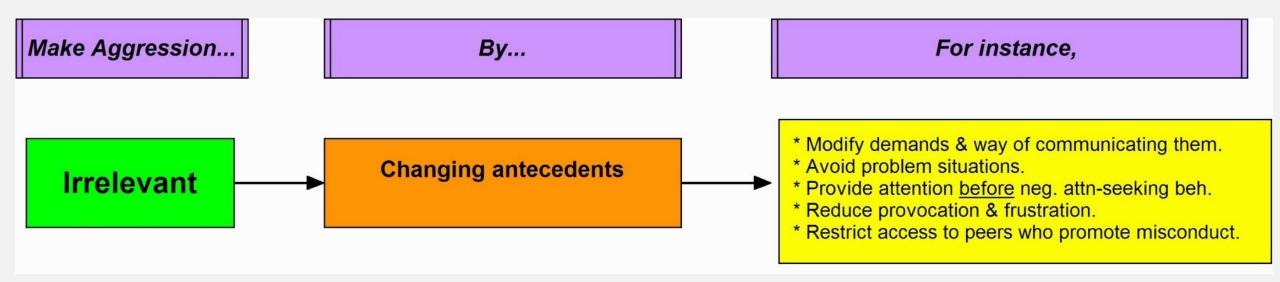

Psychosocial Treatments

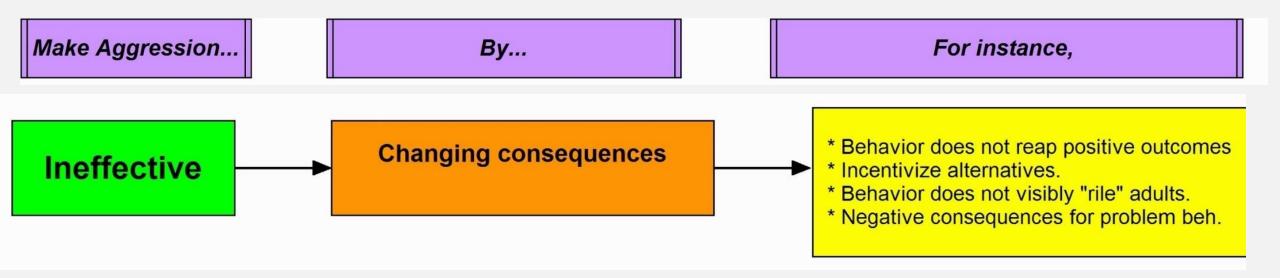

Psychosocial Treatments: Antecedents

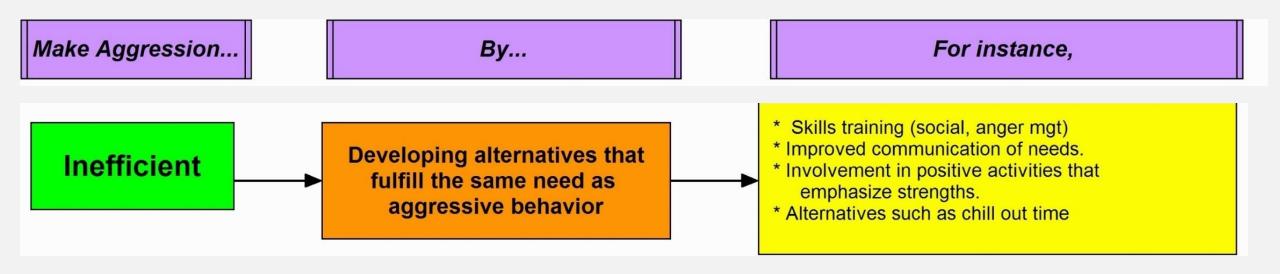

Psychosocial Treatments

Psychosocial Treatments

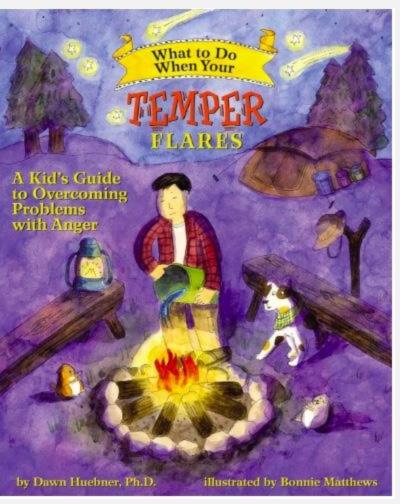

Behavioral Principles

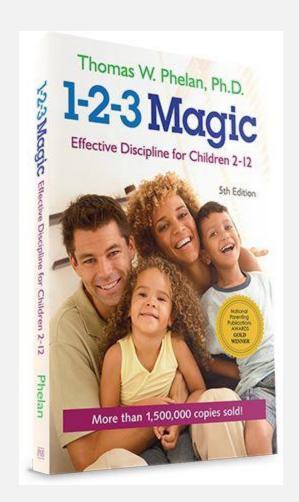

- Involve the parent: "I can't do it without you. Pills alone won't give your child the skills he/she needs."
- First focus on engagement and positives (e.g. play, read, "catching them being good"
- Attention to how limits set and structure provided at home
 - Proactive parents better than reactive. Pre-decided realistic positive rewards and consequences are most useful.
 - Parents need to be clear about which problem behaviors targeted and be clear about when occurrence is a problem.
 - Ignoring behaviors. Parents should track relative positive and negative comments. Under stress we all tend to be negative in tone.
 - Apply fairly and nonjudgmentally/ "emotionally neutral".
 - All parental figures work together and follow through.

T-MAY Recommendations

Medication Treatments:

- Treat the 1° Disorder (underlying condition) first, using recognized guidelines for that disorder.
- ONLY IF severe aggression persists after adequate psychosocial & medication treatments for the 1° Disorder, <u>add an AP</u>
 - If first AP fails, try another, or consider mood stabilizer
- If possible, avoid using more than two psychiatric medications simultaneously
- Use recommended titration schedule and deliver adequate doses before adjusting or changing medications

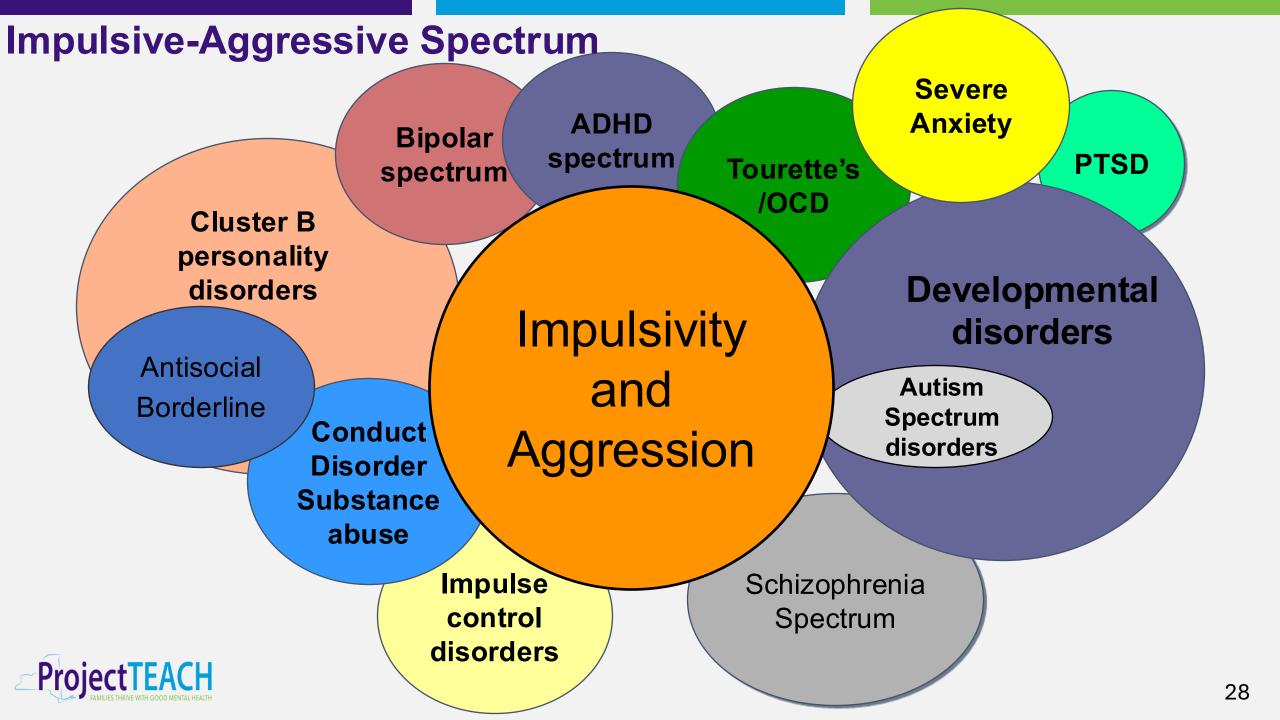

26

Identify and Treat the Primary Issue First

 Don't start a referral, medication, or therapy for "aggression" until we have implemented treatment for the primary problem

DSM Diagnoses with Aggression

- Anxiety
- Autism Spectrum Disorders
- ADHD
- PTSD
- Impulse Control Disorders
- Bipolar Disorder

- Disruptive Mood Dysregulation Disorder (DMDD)
- Conduct Disorder
- Substance Use Disorders
- Schizophrenia/ Psychotic Disorders
- Personality Disorders/ Cluster B/ Antisocial Personality Disorder

What is the Place of Medication in the Management of Aggression?

 Treatment of the underlying condition- e.g. ADHD – stimulant, non stimulant such as alpha-2 agonist

Anxiety/Depression – SSRIs- etc.

View aggression as a symptom, not a diagnosis!

Methylphenidate in ADHD/CD: Impulsive Aggression

*Sum of 5 items, range 0-15 Klein RG et al. *Arch Gen Psychiatry.* 1997;54:1073-1080 31

Before adding medications for aggression, make sure the medications for the primary disorder have been maximized

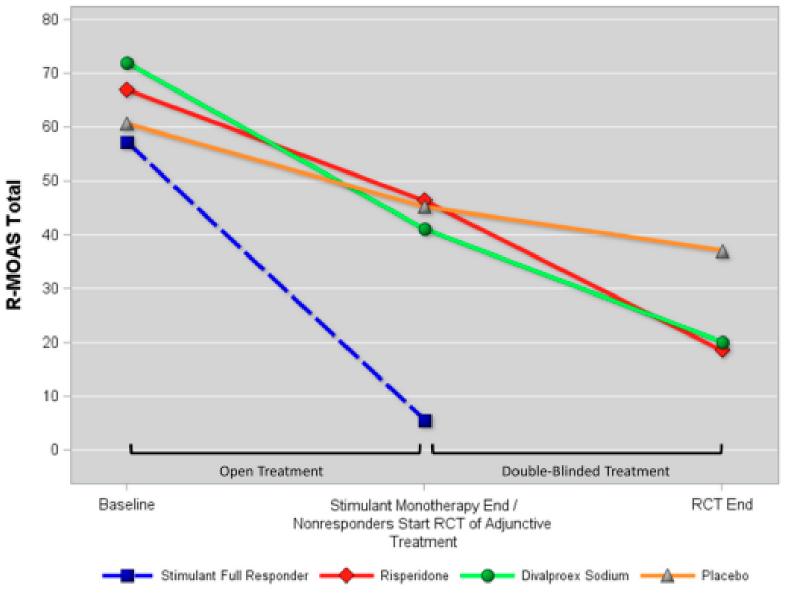

Optimize meds for the primary disorder first

- Don't add an alpha agonist or an atypical antipsychotic to combat aggression in an ADHD child until we have maximized stimulants.
 - If stimulant has been optimized, then consider alpha-2 agonist if sx persist, before adding atypical.
- Don't add an antipsychotic for an aggressive anxious child until SSRI trials have truly failed

FIGURE 3 Retrospective Modified Overt Aggression Scale Scores of Treatment Groups

Joseph Blader et al JAACAP 2021

Stepped Treatment for ADHD and Aggression

Note: RCT = randomized controlled trial; R-MOAS = Retrospective Modified Overt Aggression Scale.

IF severe aggression persists despite,

- treatment of the underlying condition has been optimized
- psychosocial treatments are not successful
- control of the initial level of aggression is urgent
- Consider: second generation antipsychotic medication trial

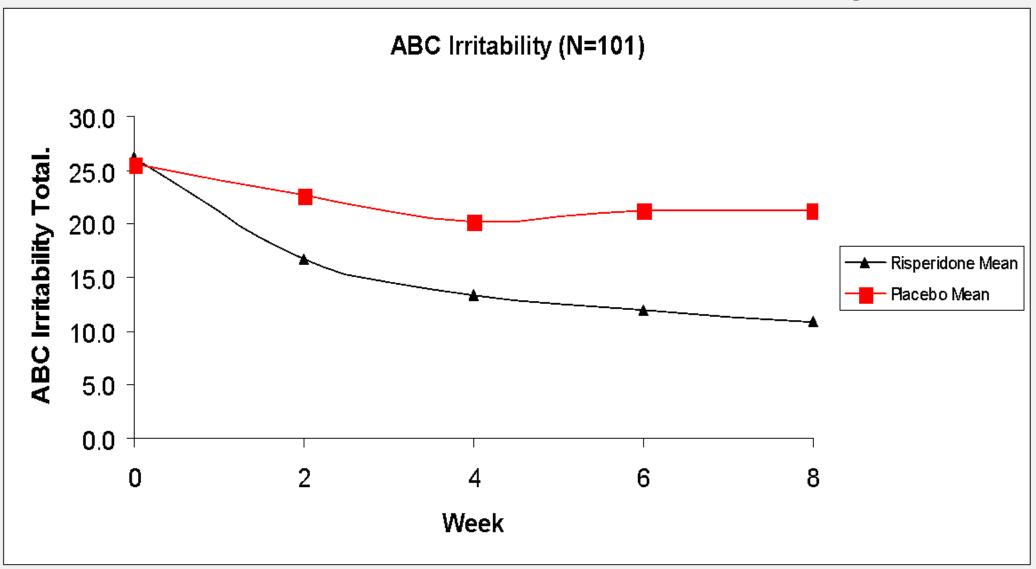

Dopamine-Serotonin Antagonists in Pediatric Primary Care

Medication	Brand Name	FDA approval	Dosing forms	Starting dose children	Starting dose adolescents	Target dosing aggression	Target dosing psychosis/ Bipolar

Taper®r®discontinue@medications@n@atients@who&how@@emission@n@aggressive@ymptoms@a@months@

 Guidelines recommend maintaining an atypical for about 6 months. IMPORTANT TO EDUCATE AT THE OUTSET

 The intent is to build self regulation skills that will allow the gradual withdrawal and cessation of meds after 6 months

T-MAY Recommendations

Ongoing Management

- Start low, go slow, taper slow (25% dose reduction every 2-4 weeks)
- Routinely assess for side effects and drug interactions, including clinically relevant metabolic studies
- Provide info to children & parents re: side effects
- Collaborate with medical, educational, and/or MH specialists as needed

45

Reassess Reassess Reassess

Medications needed for aggression at one time may no longer be needed.

Don't blindly refill prescriptions or accept another provider's refills without a reassessment

Aggression Treatment Pearls

- Form a team Enlist the family in reading (Ross Greene, etc.) and problem-solving
- Diagnose and aggressively treat any underlying disorder, especially ADHD/ODD
- Encourage use of behavioral strategies, building new skills
- If/when all of the above aren't enough, consider atypical or other agents!
